

Integrating Behavioral Health Care and HIV Care

Francine Cournos, M.D.

Co-Principal Investigator, Northeast/Caribbean AETC Professor of Clinical Psychiatry, Columbia University fc15@cumc.columbia.edu

Disclosure

This program is supported by the Health Resources and Services (HRSA) of the U.S. Department of Health and Human Services (HHS) as part of an award totaling \$3,879,101 with zero precent financed with nongovernmental sources.

The contents are those of the author(s) and do not necessarily represent the official views of, nor an endorsement, by HRSA, HHS or the U.S. Government.

The Brain and the Body Are One

- The brain controls life's essential involuntary bodily functions, such as breathing and heart rate.
- The brain tells the body what voluntary physical actions it must take to survive, such as eating or running away.
- The body provides continuous feedback to the brain, such as my stomach is full or my muscles are tired.
- The brain and the body are a single system.

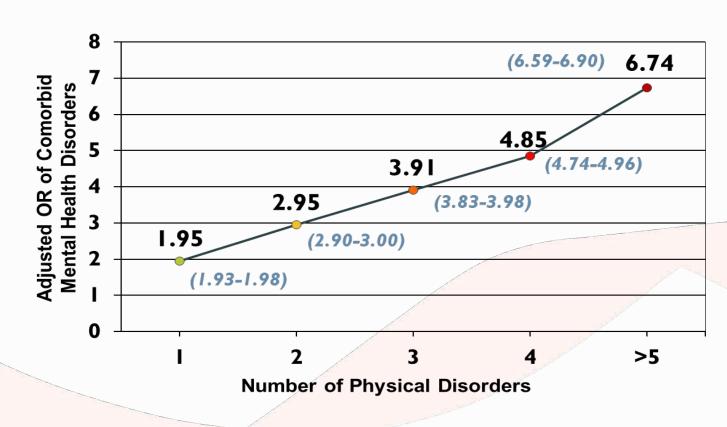

The Comorbidity of Physical and Mental Disorders

- Despite the fact that the brain and the body form an integrated system, the care for them exists in siloes.
- This reflects the stigma of mental illness pervading health care provider education.
- Fear of abnormal behavior is used to construct an artificial separation between the brain and the body.
- Health care providers often believe taking care of people with mental illness is not their job.

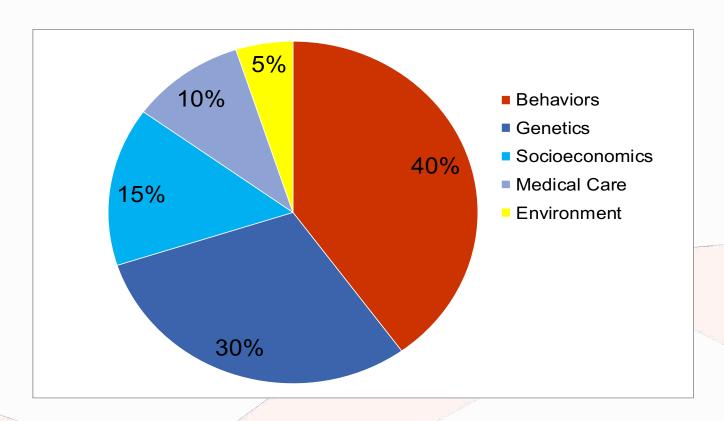

But Poor Physical Health and Poor Mental Health Travel Together and Cannot Be Separated

The HIV Care Continuum Can Be Applied to Create a Behavioral Health Care Continuum

HIV Testing and Diagnosis

Linkage to Care

Retention/
Engagement to Care

Antiretroviral Therapy

Viral Suppression

HIV Care Continuum

Behavioral Health Screening

Diagnostic Evaluation Linkage to BH Treatment Evidence-Based Treatment Retention/ Engagement in BH Care

Improvement in BH Outcomes

Behavioral Health Continuum

Based on multiple sources reviewed by the presenter

But How Do These Two Care Continuums Come Together?

Referral/Consultative Model

 Mental health clinician (who is often off site) sees patients alone and to varying degrees reports back to primary care providers

Co-located Model

 Mental health clinician sees patients adjacent to or within the primary care setting itself with varying degrees of care coordination

Integrated Care Model

 Team based care in which primary/HIV care providers work with mental health clinicians as part of a single team that engages in ongoing communication

Based on multiple sources reviewed by the presenter

Collaborative Care (Adopted and Disseminated by the American Psychiatric Association)

Collaborative Team Approach PCP Core **Program** Consulting **BHP/Care Patient Psychiatrist** Manager **Additional Clinic** Other Behavioral **Health Clinicians** Resources Outside **Substance Treatment, Vocational** Resources Rehabilitation, CMHC, **Other Community Resources**

Legend:

PCP - Primary Care Physician

BHP – Behavioral Health Practitioner

CMHC – Community Mental Health Center

Limitations of Integrated Care Models Prior to COVID-19

- Models of collaborative care usually integrated:
 - low intensity psychiatric care into primary medical care, or
 - low intensity medical care into psychiatric programs for people with severe mental illness.
- These models only achieved partial success even for integrating low intensity services.
- These models were not designed for people who require both high intensity psychiatric care and high intensity medical care.
- These models most often relied on the physical proximity of services.
 Then came the COVID-19 pandemic!
